

## Features

- Fully integrated into the Procore user experience
- Send requests to internal or external contacts
- Signatories can sign on any platform, from any device
- Signed documents are returned to the repository automatically
- Create signature templates for repeated processes
- Superior record keeping

## Dropbox Sign for Procore Overview

Dropbox Sign provides an intuitive way for the modern Constructor to send and request electronic signatures from your clients, sub-contractors and suppliers. TEAM IM's Dropbox Sign for Procore integration allows an authorized Procore user to select any document within Procore, populate the relevant properties (like signatory email addresses) and submit. Signatories will automatically receive a notification to digitally sign the document. Once all signatories have signed the fully executed version is automatically saved back into Procore.

Being able to eSign a document is great for improving workflows. When you eSign a document, you eliminate the need to print, sign and then scan it. eSign streamlines the process for completing paperwork and reduces productivity waste.

Electronic signatures are as legal as a paper signature. They are federally protected in the United States by the E-SIGN Act 2000, as well as being protected by various acts and legislations internationally. Dropbox Sign has customers across the world using electronic signatures for documents that require being bound by legality and authenticity, across Europe, Asia and beyond.
